Cotton Varieties Planted, United States  
1972-1976

Stoneville and Deltapine were the leading varieties of cotton planted in the United States in the 1976-77 season, according to the Cotton Division, Agricultural Marketing Service, USDA. Stoneville accounted for almost one-fourth of this year's acreage and Deltapine made up one-fifth. Lankart was the third leading variety, being planted on about one-eighth of the acreage. The other major varieties, Acala, Paymaster and Coker, combined, accounted for about one-fourth of the acres planted this year.

Stoneville was the leading variety of cotton planted in the United States for the second consecutive year and made up 23 percent of the 1976 cotton acreage. This compares with 19 percent a year earlier. Stoneville was the major variety planted in Alabama, Arkansas, Missouri and Tennessee and also accounted for a substantial proportion of the planted acreages in Louisiana and Mississippi. Stoneville 213, the principal Stoneville strain, represented 20 percent of the total cotton acreage.

Deltapine was the second leading variety planted. Acreage planted to Deltapine in 1976 was estimated at 20 percent, up from 18 percent a year earlier. Deltapine was the most popular variety in Arizona, Louisiana and Mississippi and was the second most popular variety in Arkansas, Missouri and Tennessee. Deltapine 16 was the predominant Deltapine strain and comprised 15 percent of the total cotton acreage planted in the United States.

Lankart was the third leading variety planted this year and accounted for 12 percent of the total acreage. This was down from 14 percent last season. Lankart, the leading variety in the Southwest, accounted for nearly one-fourth of the acreage planted in Texas and over three-fourths of the acreage in Oklahoma.

Acala, the fourth leading variety, comprised 10 percent of the total acreage planted this season, the same as a year earlier. Acala was the principal variety planted in California and New Mexico.

Paymaster was the fifth leading variety planted this year. This variety accounted for eight percent of the 1976 acreage, the same as a year earlier. Paymaster continued to be the second most popular variety in Texas where it accounted for nearly one-fifth of that state's total acreage.

The sixth leading variety planted was Coker, representing six percent of the total United States acreage. This was the same as a year earlier. Coker was the leading choice of growers in Georgia, North Carolina and South Carolina.

Pima S-5 was the leading strain of American Pima cotton planted in 1976, accounting for 80 percent of the total Pima acreage against 10 percent a year earlier. In 1975, Pima S-4 was the leading strain, making up 75 percent of the acreage. Pima S-4 was the second leading strain this year at 16 percent of planted acreage.

Estimates of the percentages of the various varieties of cotton planted in the United States in 1976, by counties, Smith-Doxey cotton classing office territories and states are presented in this report. Comparative variety data for the four years 1972-75 are shown by states. The variety data are based primarily on estimates furnished by cotton ginners for the territories served by their gins.

1/ Compiled from "Summary of Cotton Fiber and Spinning Test Results, Crop of 1975", USDA, AMS, Cotton Division, May 1976.

2/ Micronaire reading is a measure of fiber fineness and maturity. This test measures resistance of a plug of cotton to air flow.

3/ Fiber strength indicates ability of cotton fibers to withstand force or tension, and has a strong bearing on spinning utility. Zero gage fiber strength test made without a spacer between clamp jaws using Pressley flat bundle tester. 1/8" gage strength test made with 1/8" spacer between clamp jaws using Stelometer and results are adjusted to the Pressley level.

4/ Digital Fibrograph 2.5% span length indicates length spanned by 2.5 percent of the fibers when they are parallel and randomly distributed. This measure is closely related to staple length designations. Digital Fibrograph 50/2.5 uniformity ratio values indicate relative uniformity of fiber length in samples.
